No.1 Growth Consultant,
3-time Award-winning OKR
Consultant and SME

Swipe Right

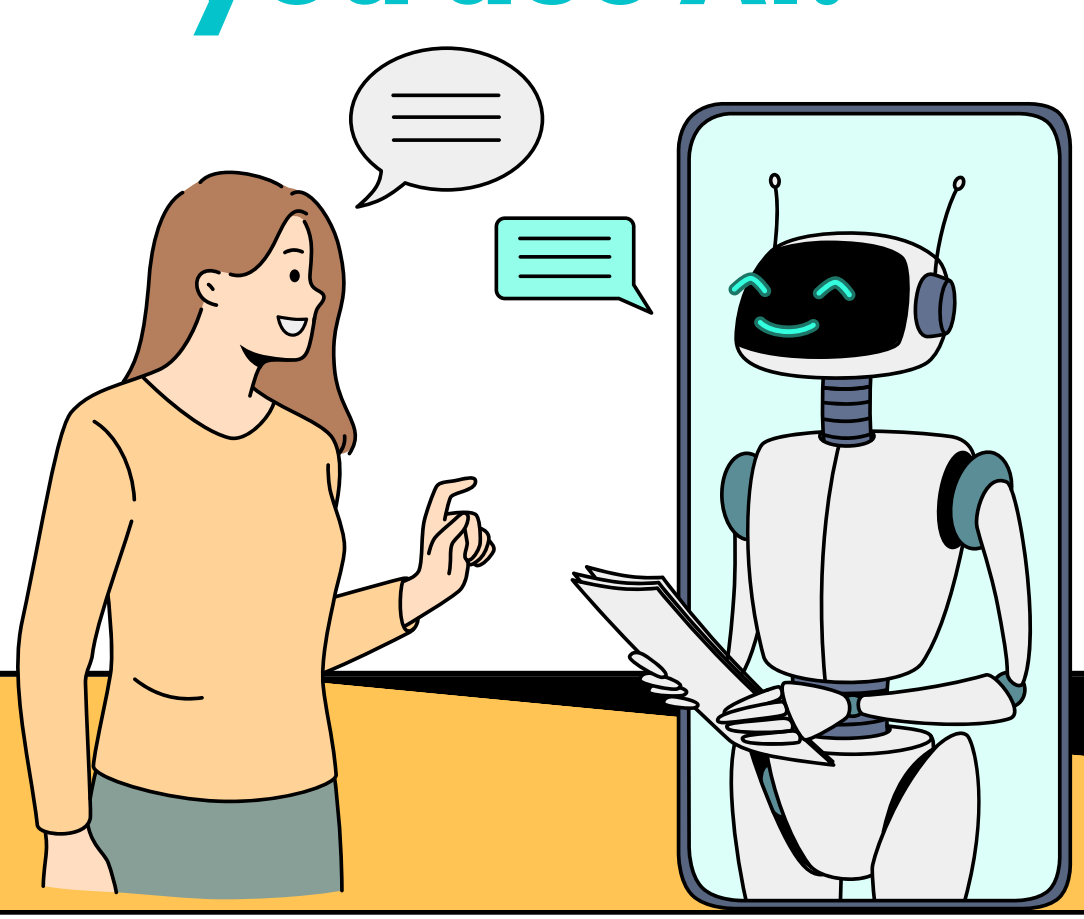

Most OKRs generated by AI are not correct.
The fault lies in what has been fed to AI.
GARBAGE IN, GARBAGE OUT.

If YOU understand the purpose, foundation and syntax of OKRs, then you can take AI help to, not generate,
but FINE-TUNE your OKRs.

By all means use AI but HOW is the question.

Where CAN you use AI?

To improve Data-driven Decision Making:

AI algorithms can analyze large amounts of EXISTING data and provide insights that humans may miss.

Efficiency:

Use AI to track, connect, and review better and faster. Free up your time.

New Employees Orientation:

Use AI to quickly train new joiners and help them understand and personalize OKRs through trial and error. The key here is to understand how to write OKRs oneself.

Discipline of Execution:

AI can continuously monitor progress of OKRs and provide real-time feedback, enabling managers to course-correct as necessary.

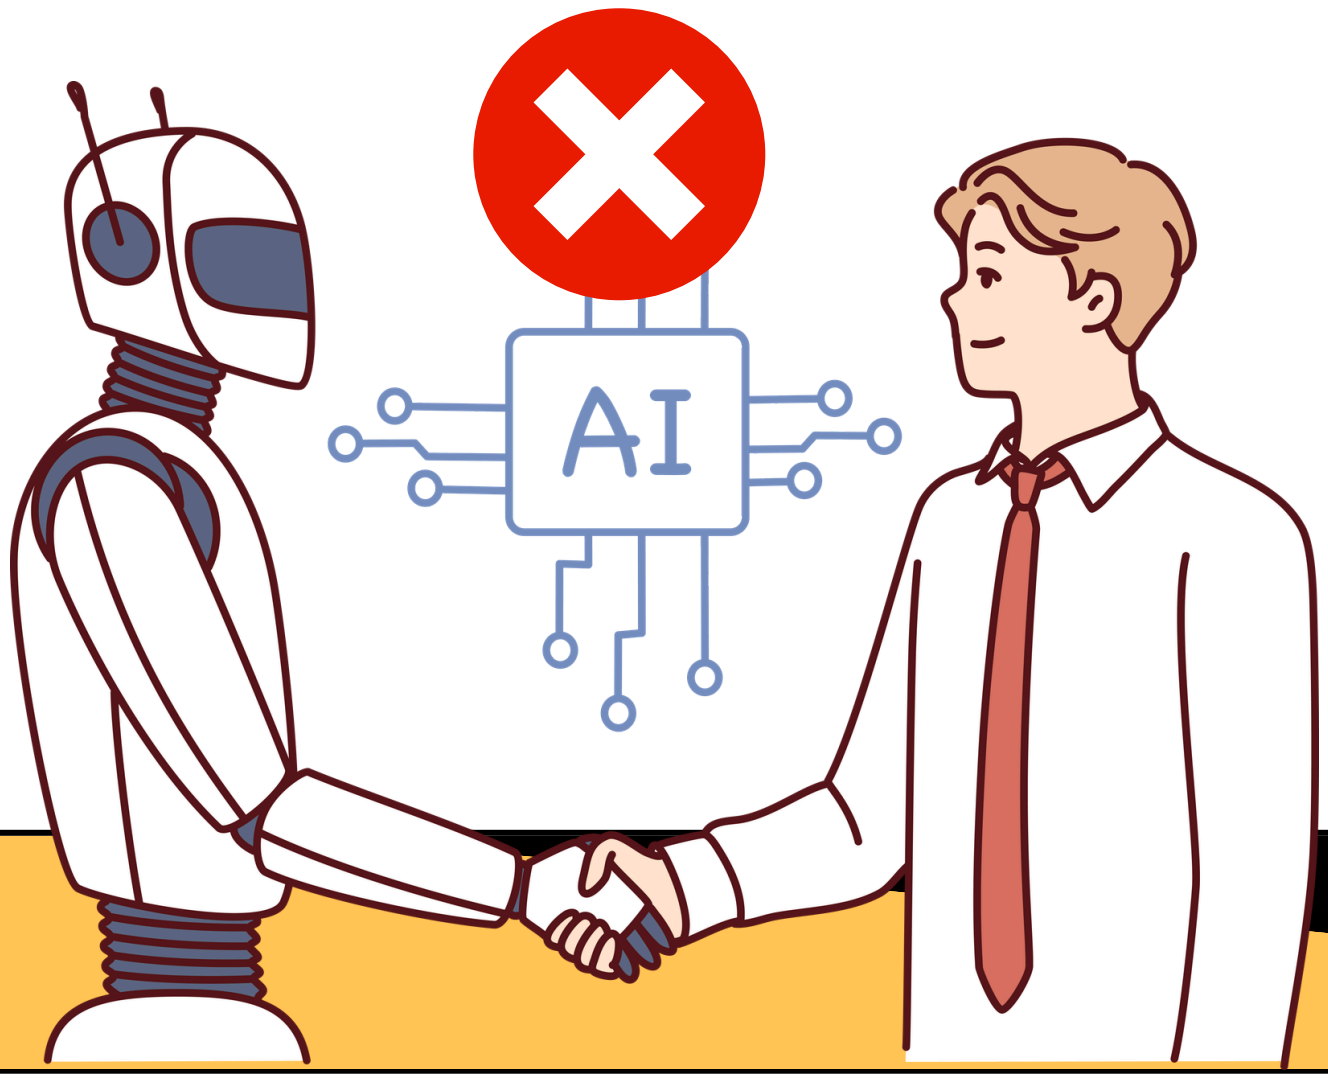

Cost Savings:

AI based tools help by automating the OKR rigor and save on the cost of hiring additional governance personnel.

OKR LEAGUE

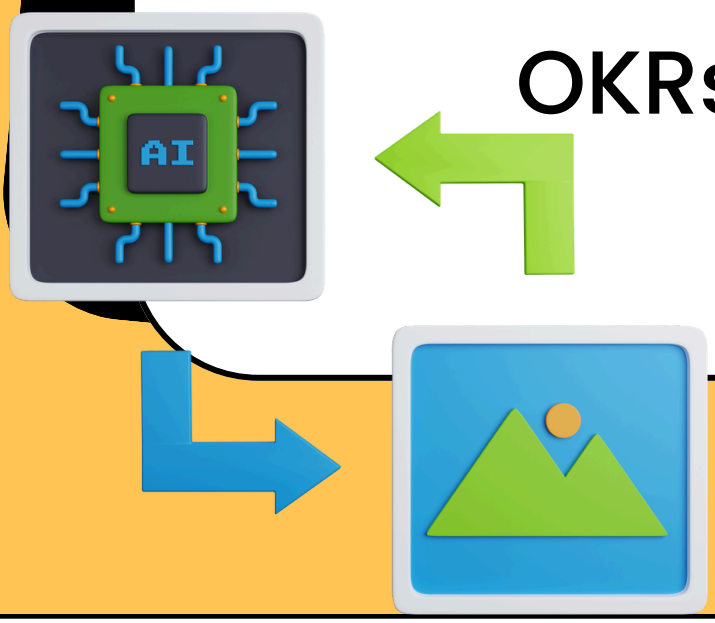

Where you should NOT use AI:

www.okrleague.com

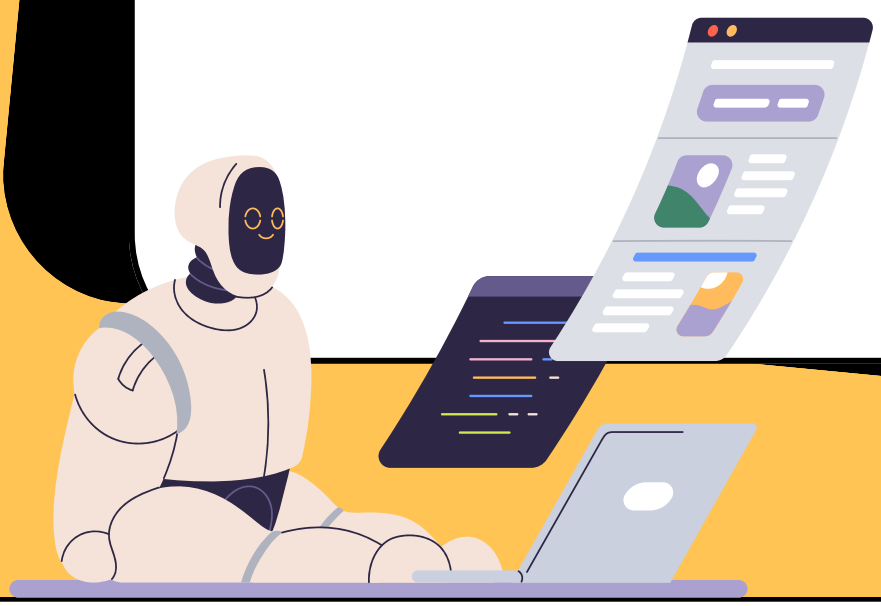

To "Generate" OKRs:

If OKRs are so difficult to write, that you need a tool to understand your business and function for you, do not do OKRs until you hire an experienced OKR coach who can help you practically understand OKRs beyond jargons.

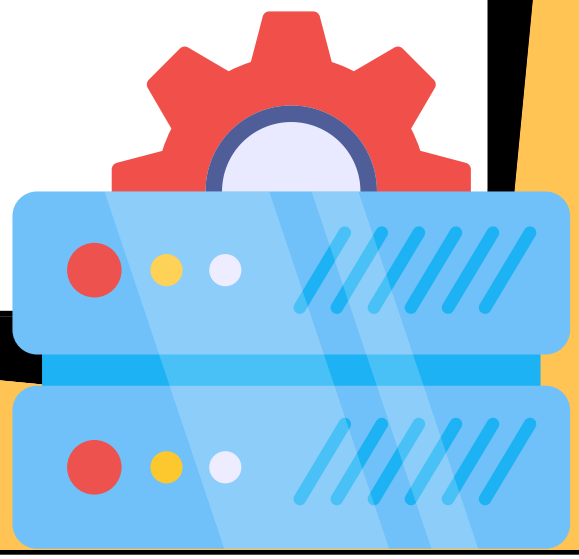

First-time Implementations:

AI-generated OKRs may lack the nuanced understanding of your organizational culture and employee need; nor the job-role impact. Get an experienced OKR expert to orient the entire company.

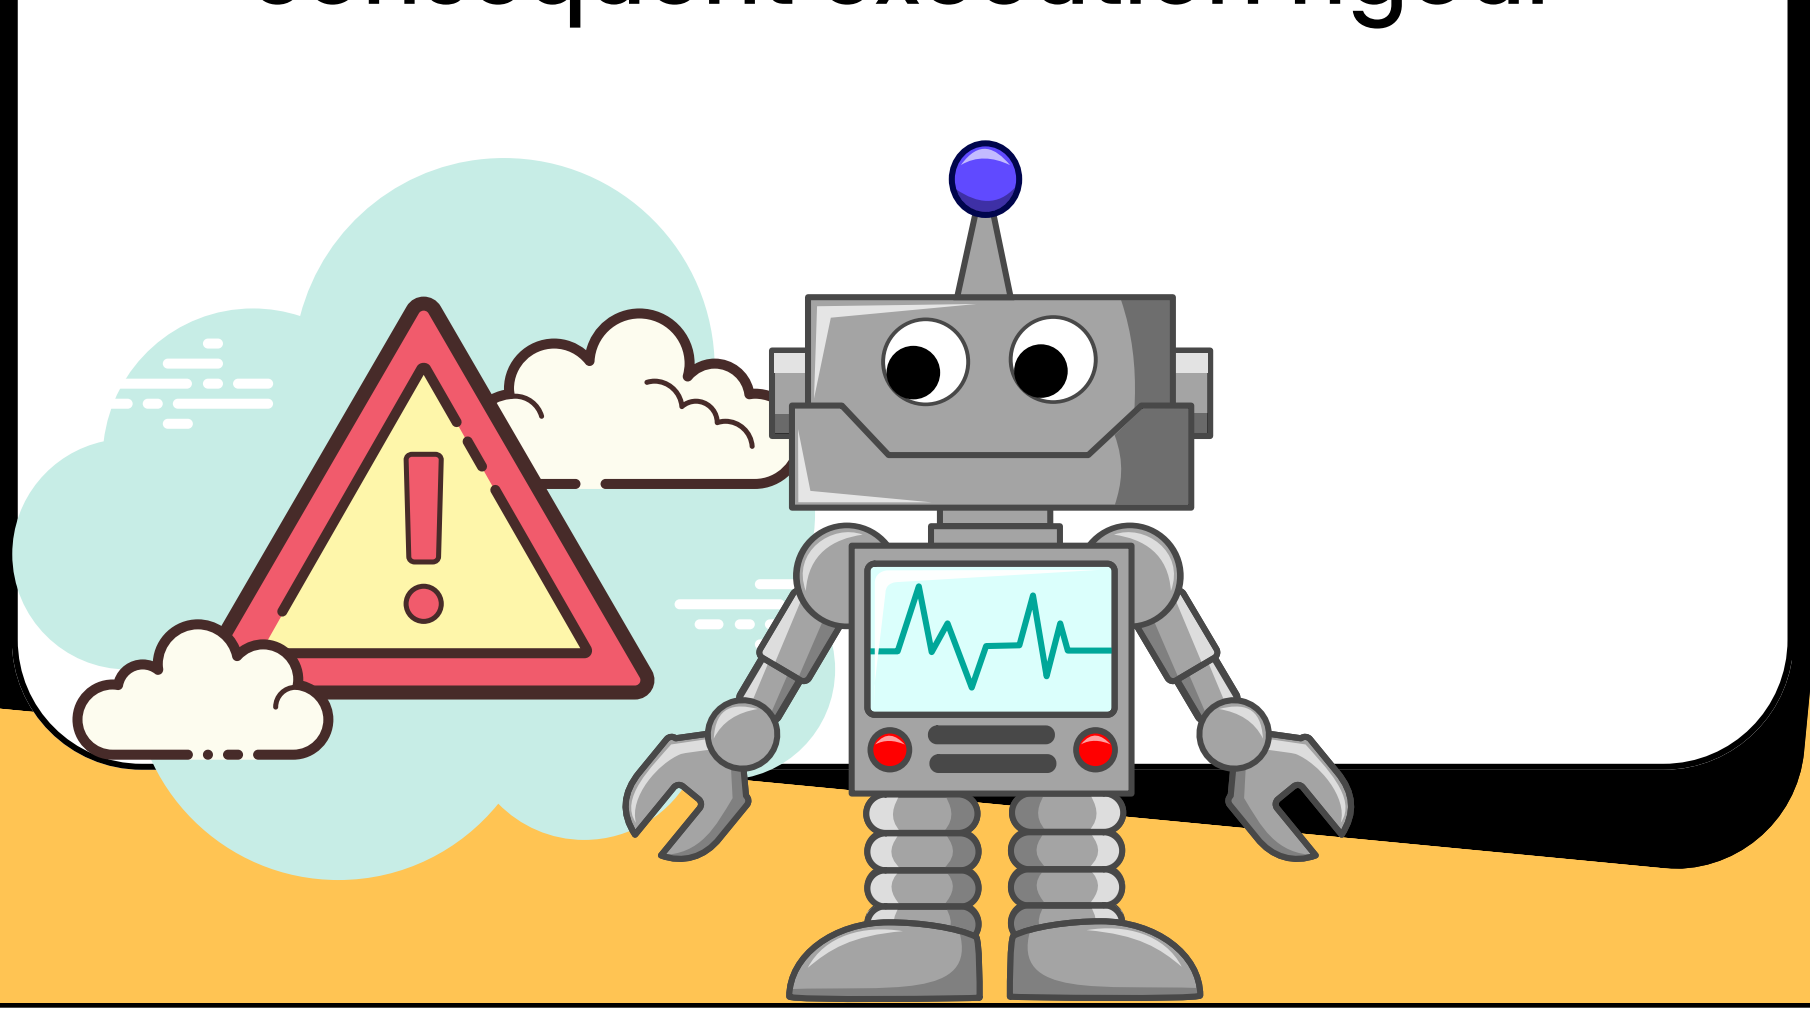

Unreliable OKR Databases:

Most OKR examples on the internet are inaccurate. They are not defined scientifically nor differentiate between objectives, key results, initiatives, tasks, the mapping process, etc. And it is **this very bank** that AI will draw from. Stop the wrong flow before it starts. Do OKRs right from day 1.

Technical limitations:

AI is not infallible, and errors in data or algorithms could lead to inaccurate OKRs and the consequent execution rigour

Resistance to change:

Some employees may be resistant to AI-generated OKRs, viewing them as impersonal or unfair without healthy discussions with managers.

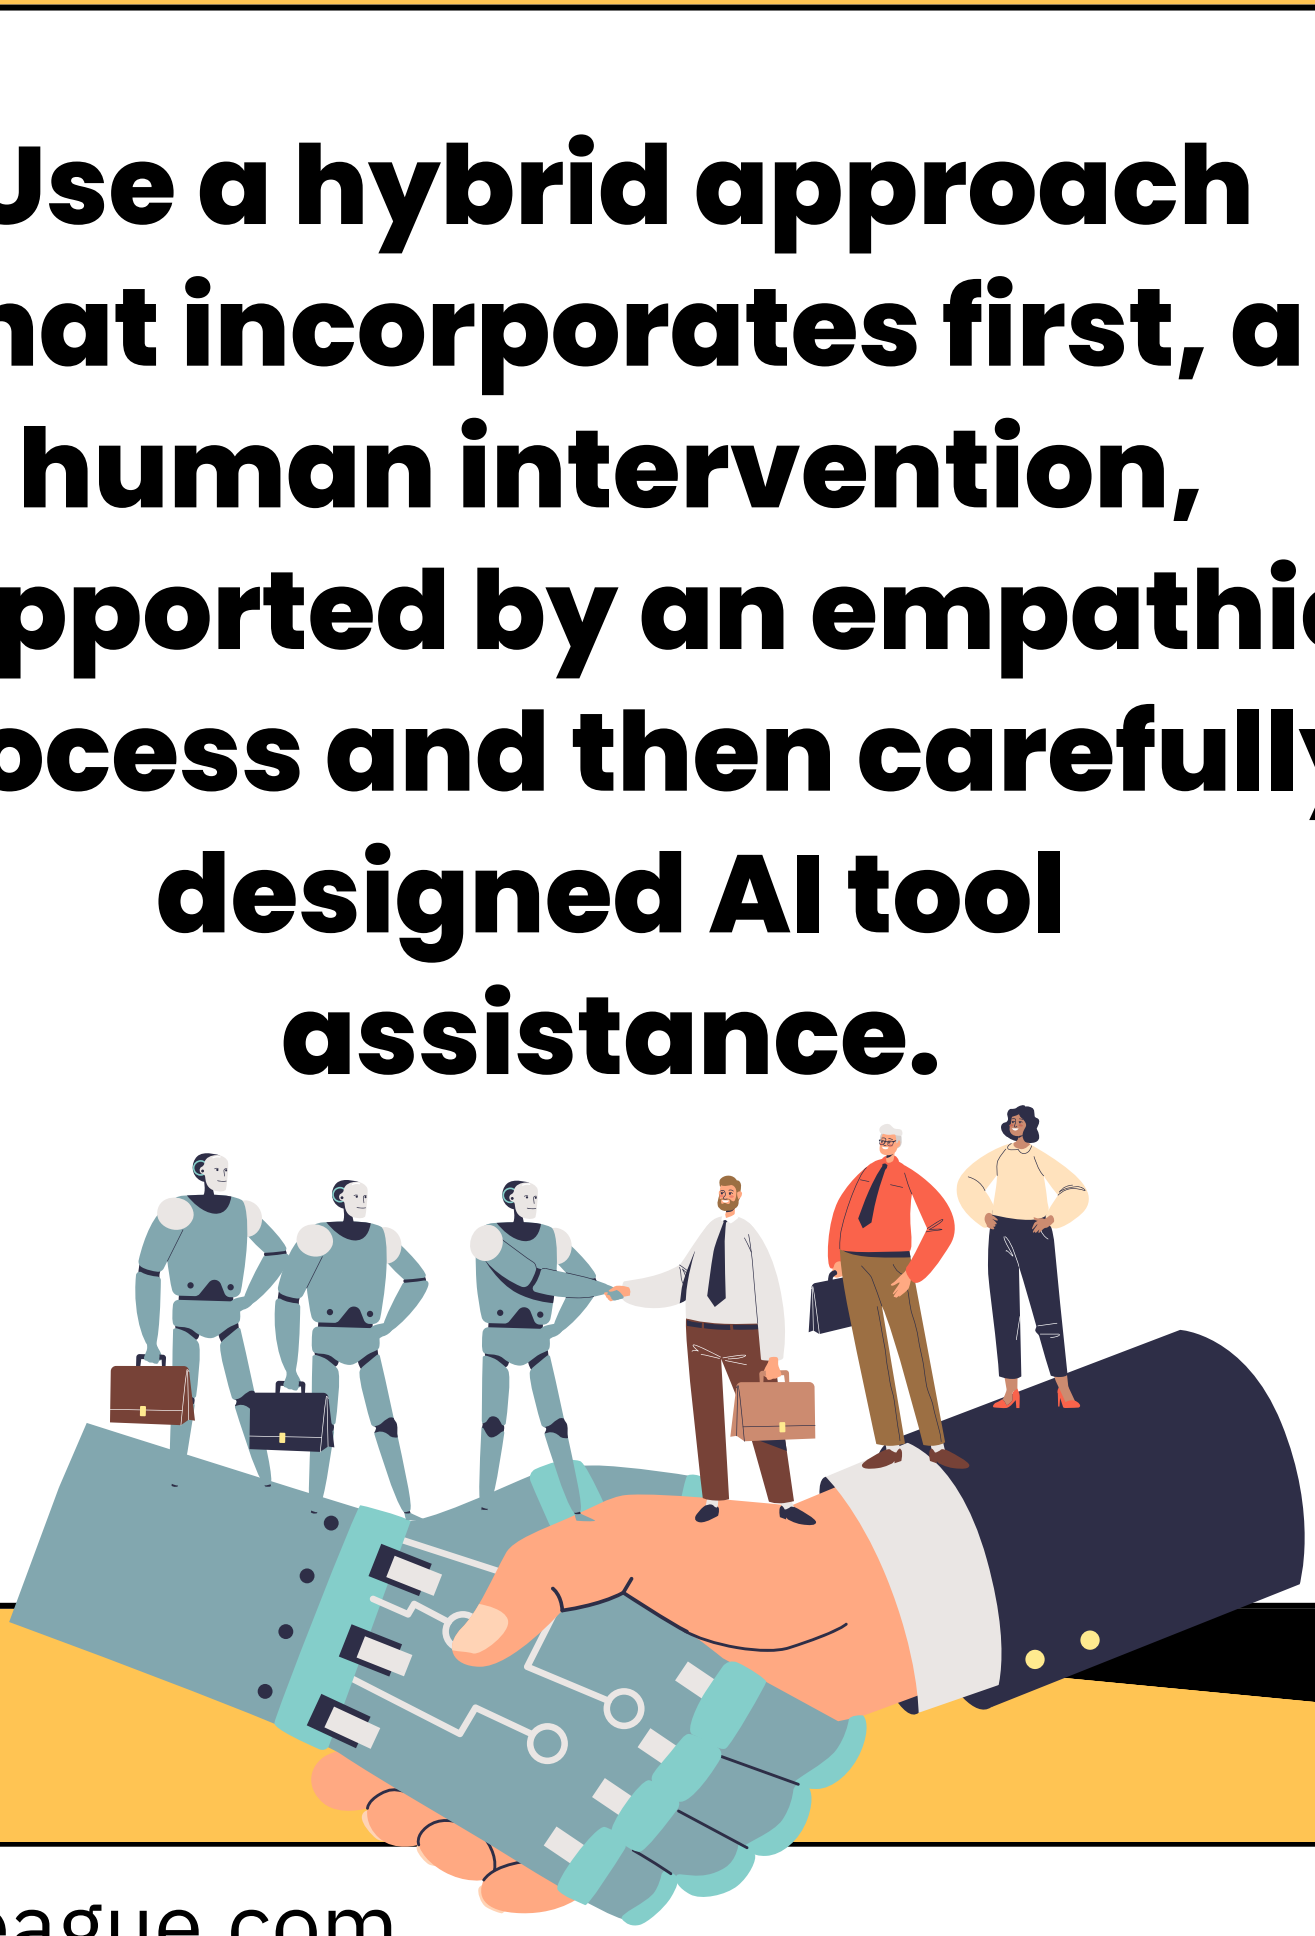

Ethical concerns:

There are ethical considerations around the use of AI to make decisions that could impact organization's / employees' performance and opportunities for advancement.

Use a hybrid approach that incorporates first, a human intervention, supported by an empathic process and then carefully designed AI tool assistance.
